BloomPro Studio

USER HANDBOOK

Your Complete Guide to Running Daily Florist Operations

2026 EDITION

2026 EDITION

ABOUT THIS HANDBOOK

BloomPro Studio

BloomPro Studio is a business operating platform for florists. It connects the work you do every day — customers, orders, design and production, deliveries, payments, purchasing, inventory, and accounting — in one place, so information entered once flows to everywhere it is needed.

Handbook Version	1.0
Edition	2026
Product	BloomPro Studio
Publisher	AF Strategic Technologies LLC

© 2026 AF Strategic Technologies LLC. All rights reserved. BloomPro Studio features evolve over time; screenshots and labels in this handbook may vary slightly from the release you are using. Screens also vary by user role, company, branch, language, and permissions. This handbook documents standard product behavior and never describes ways to bypass application security or business controls.

WELCOME

Welcome to BloomPro Studio

How the pieces of your florist business fit together.

Every flower shop runs two connected stories at once. The first is the **customer story**: someone orders an arrangement, your designers create it, a driver delivers it, and the customer pays. The second is the **supply story**: you buy stems from wholesalers, receive them into inventory, and those costs determine what each arrangement really earns you.

BloomPro Studio keeps both stories in sync automatically. When you confirm an order, deliver an arrangement, or receive a shipment of roses, the platform updates inventory, customer balances, and your books — so your reports reflect what actually happened in the shop.

The customer story

Customer

Order

Production

Delivery

Payment

Accounting & Reporting

The supply story

Purchasing

Receiving

Inventory

Order Cost & Margin

Costs recorded at receiving flow into each delivered order's cost of goods — which is how BloomPro Studio knows your true margins.

ORIENTATION

How to Use This Handbook

Reading conventions used throughout every chapter.

Chapters follow a consistent pattern: an overview, a screen orientation, step-by-step tasks, the business rules that protect your data, and answers to common questions. Skim the panels — they carry the most important knowledge:

TIP

A helpful shortcut or a faster way to work.

IMPORTANT

Behavior you must understand before acting — usually a business rule the application enforces.

WARNING

An action with financial or operational consequences that are hard to undo.

ADMIN ONLY

A capability available only to Owner or Admin roles in the active company.

BEST PRACTICE

A professional florist-business recommendation from real operating experience.

IMPORTANT

What you see on screen depends on your **user role**, the **active company**, your **branch**, your **language**, and your permissions. If a control described here is not visible to you, it is usually a permissions difference — not an error. See Chapter 22.

01 GETTING STARTED

Sign in, learn the layout, and find your way around.

~4 min read

ALL ROLES

Signing in

- 1 Open the BloomPro Studio sign-in page provided by your administrator.
- 2 Enter your **email address** and **password**, then select **Sign In**. Google sign-in is also supported where enabled.
- 3 You arrive on the **Dashboard** for your active company.

WHAT HAPPENS NEXT

BloomPro Studio loads your company membership and permissions. Everything you see from this point — records, menus, actions — belongs to your active company.

The application layout

The BloomPro Studio workspace: sidebar navigation (left), top bar (top), and the working area.

- **Sidebar (left)** — modules grouped as Operations, Commerce, and Business.
- **Search (top bar)** — find records from anywhere.
- **Language selector (top right)** — English, Español, Français, Nederlands.

- **Notifications bell (top right)** — operational alerts.
- **Profile & role badge (top right)** — your role in the active company.

GROUP	MODULES
Operations	Dashboard · Orders · Deliveries · Events
Commerce	Storefront · Products · Customers · Subscriptions
Business	Inventory · Finance · Receivables · Purchasing · AI Reconciliation · Reports · QA Tools · Settings

Your first 10 minutes

- 1 Check the **role badge** (top-right). It shows your role in the active company — this controls what you can do.
- 2 Open **Orders** and skim today's list so you know what is in flight.
- 3 Open **Dashboard** → **Today's Operations** to see production and delivery work for the day.
- 4 Set your **language** from the top bar if you prefer Spanish, French, or Dutch.
- 5 Find your name under **Settings** → **User Access Control** (visible to admins) or ask your administrator what your role allows.

TIP

The sidebar is your map. If you are ever lost, return to **Dashboard** — it summarizes everything that needs attention today.

02

UNDERSTANDING THE DASHBOARD

Your operational command center for the day.

~4 min read

ALL ROLES

Overview

The Dashboard answers one question: *what needs my attention right now?* It combines revenue and pipeline indicators with actionable work queues.

Use this module when...

- You open the shop and want a picture of the day.
- You need to move today's orders through design, dispatch, and delivery quickly.
- Stock is running low and you want to restock without leaving the page.
- A high-priority order needs confirmation or a driver.

Work queues that act

PANEL	WHAT IT SHOWS	ACTIONS AVAILABLE
Today's Operations	Today's deliveries, the production queue, and urgent orders	Move an order through production, dispatch, and delivery with Resolve Status ; assign drivers
Action Required	Low-stock items, unassigned orders, unconfirmed high-priority orders	Restock inventory, assign couriers, confirm orders
KPIs	Gross revenue, design pipeline, transit status, outstanding balance (AR)	Reference only — click through to modules for detail

IMPORTANT

Dashboard buttons perform **real operational updates**. When you see a success message, the action has been completed and saved — the order status, inventory quantity, or assignment has genuinely changed. If an action cannot be completed (for example, delivering an order that still has a balance due), BloomPro Studio shows the reason instead of a success message.

BEST PRACTICE

Start each morning from Today's Operations. Clear the urgent queue first, then work the production queue in delivery-time order.

03

CUSTOMERS

~4 min read

Create and manage the people and businesses you serve.

OWNER

ADMIN

MANAGER

SALES

Overview

Use this module when... a new customer calls to place an order · a regular updates their phone number or delivery address · you want to review a customer's order history before a call · you are preparing statements or reviewing receivables.

Client Relationships (CRM)
Manage client dossier profiles, track purchase metrics, configure loyalty tiers, and audit accounts.

Statistics:

- TOTAL CRM PROFILES: 5 Clients (Active database contacts)
- LOYALTY MEMBERS: 0 Tiered (Silver, Gold & Platinum status)
- LIFETIME VALUE (LTV): \$5,875.00 (Cumulative revenue settled)
- OUTSTANDING (AR): \$0.00 (Uncollected client ledger credit)

Client Table:

CLIENT NAME	CONTACT INFO	ACCOUNT TYPE	LOYALTY LEVEL	TOTAL ORDERS	OPEN BALANCE	LIFETIME VALUE	ACTION
Eleanor Vance ID: C1	owner@bloompro.demo 555-0101	RETAIL	BRONZE	8 orders	\$0.00	\$1250.00	View Profile
James Sterling ID: C2	owner@bloompro.demo 555-0102	RETAIL	BRONZE	3 orders	\$0.00	\$450.00	View Profile

The Customers module: search by name or email (top), **Add Customer** (top right); each row opens the full customer dossier.

Create a new customer

- 1 Open **Customers**.
- 2 Select **Add Customer**.
- 3 Enter the customer's name and email (required), plus phone, addresses, and preferences.
- 4 Review the information and select **Create**.

WHAT HAPPENS NEXT

The customer dossier is saved and immediately available when creating orders, and their activity begins accumulating for accounts receivable and statements.

Example — Maria Rodriguez's birthday order

Maria Rodriguez calls to order a birthday arrangement for Friday delivery. You create her customer dossier once — name, mobile number, and her sister's delivery address. When you create Friday's order, you enter Maria as the customer; her order joins her history, her payment reduces her balance, and if her company ever runs an account, her statement shows every order and payment in one place.

BEST PRACTICE

Search before you create. Duplicate customer records split order history and make statements confusing. One customer, one dossier.

Common questions

Can I delete a customer? Owners and admins can remove a customer dossier. Their historical orders and financial records remain part of your books — deletion removes the dossier, not your accounting history.

04

PRODUCTS

The catalog of arrangements and items you sell.

~3 min read

OWNER

ADMIN

MANAGER

Overview

A **product** is something you sell — "Juliet Rose Bouquet," "Seasonal Sympathy Spray." Each product has a name, an **SKU** (its unique stock code), a price, and a status controlling availability.

IMPORTANT

A product is not the same as inventory. The product defines *what* you sell and at what price. Inventory tracks *how many* units of the underlying stock you actually have. When an order asks for more than inventory can supply, BloomPro Studio flags a backorder (Chapter 08).

Use this module when... adding a new seasonal arrangement · adjusting prices · retiring an item · checking which SKU an arrangement uses.

BEST PRACTICE

Keep product prices current. Order lines pick up the product's price at the moment you add the line — stale prices become stale quotes.

05

INVENTORY

What you actually have in the cooler, by SKU.

~5 min read

OWNER
ADMIN
MANAGER
DESIGNER

Overview

Use this module when... checking stock before confirming a big order · reviewing quantities after a delivery from your wholesaler · recording spoiled stems · investigating a shortage warning.

Inventory tracks each SKU's on-hand quantity, cost, and reorder point.

Available, ordered, backordered

When an order line asks for more than you have, BloomPro Studio determines the shortage automatically:

Available (in inventory)	12
Ordered (on the order line)	20
Backordered (shortage)	8

Backordered = Ordered – Available, never less than zero. The quantity is always calculated for you — it cannot be typed by hand.

Chapter 08 covers the full backorder workflow, including the required reason before an order can be confirmed.

WARNING

Inventory numbers drive shortage detection, costing, and margins. Recording spoilage late or skipping receiving makes every downstream number wrong.

BEST PRACTICE

Count your coolers weekly. Small, frequent adjustments beat one painful quarterly correction.

06

ORDERS

~8 min read

Create, edit, duplicate, and manage every sale.

OWNER

ADMIN

MANAGER

SALES

DESIGNER

Overview

Orders are the heart of BloomPro Studio. An order carries the customer, recipient and delivery details, product lines with quantities and pricing, payment state, and its position in the fulfillment lifecycle.

Use this module when... taking a phone order · editing quantities before production · duplicating a repeat order · checking a balance · moving an order's status.

The Orders module: pipeline filters across the top (All / Drafts / Confirmed / In Design / Transit / Delivered / Cancelled), search by order, client, or recipient, and **Create Order** (top right). Each row carries its own status selector and **Edit**; **Post to Ledger** appears on unposted orders.

Create an order

- 1 Select **Create Order**. The order editor opens on the **Order** tab — set the status (new orders usually start as **Draft**) and priority.
- 2 On the **Customer** tab, enter the customer (sender) and the recipient.
- 3 On the **Delivery** tab, enter the delivery date and address — these are required.
- 4 On the **Items** tab, add product lines. Pick the product, set the quantity; pricing and the line total fill in automatically. Totals (subtotal, taxes,

delivery fee, grand total) recalculate live.

- 5 On the **Payment** tab, record any amount already paid (a phone deposit, for example).
- 6 Select **Create**.

WHAT HAPPENS NEXT

BloomPro Studio saves the order with a unique order number (BLM-...), posts the sale to your books, and the order appears in the pipeline. If any line is short on stock, the backorder card appears before you save (Chapter 08).

A complete example

Friday, 9:12 AM. Maria Rodriguez orders a birthday arrangement (1 × Juliet Rose Bouquet) delivered to her sister on Friday afternoon, and pays in full by card. You create the order with the delivery address, quantity 1, record the payment for the exact grand total, and set the status to **Confirmed**. The order number BLM-7A2FQ is now visible to the design team, the sale is on your books, and Maria's balance is zero.

Edit, duplicate, and balances

- **Edit** — open any order with its **Edit** button. Changes save when you select **Save Changes**; the totals recalculate.
- **Duplicate Order** — from an open order, creates a fresh **Draft** copy with a new order number and a clean payment state (unpaid, no accounting linkage). The original is untouched. Perfect for weekly corporate arrangements.
- **Balance due** — grand total minus amount paid. An order cannot be marked Delivered while a balance remains (Chapter 07).

IMPORTANT

Amount paid cannot exceed the grand total — the editor will ask you to correct it before saving.

TIP

Every order shows its identifiers consistently: the short order ID in lists, and the BLM- order number your customers can reference.

Common questions

Can I edit a delivered order? You can open it, but its lifecycle is complete — corrections belong in payments, refunds, or reversals (Chapters 11 and 17) so history stays truthful.

Why did my save not go through? Check each tab for a highlighted field — required information (customer name, recipient, delivery address and date) or a payment rule may need attention. The editor jumps to the tab that needs you.

07

THE ORDER LIFECYCLE

Every status, what it means, and the guards between them.

~6 min read

**ALL
ROLES**

WARNING

Cancelling a confirmed order is a financial event: the original sale on your books is reversed with a correcting entry. The history of both remains visible — by design.

Why can't I mark this order as Delivered?

Check, in order: **1)** the remaining customer balance — it must be zero; **2)** the current status — cancelled/refunded orders are final; **3)** required delivery information. The message shown when the change is blocked names the exact rule.

08

BACKORDERS & PRODUCT SHORTAGES

~6 min read

OWNER
ADMIN
MANAGER
SALES

What happens when a customer orders more than you have.

How detection works

While you build an order, BloomPro Studio compares each line's **ordered quantity** against the **available inventory** for that product's SKU. The moment ordered exceeds available, an amber **Backorder Detected** card appears directly under that line:

The screenshot shows the 'Create New Order' form in BloomPro Studio. The form is titled 'Create New Order' with a 'DRAFT' status. Below the title is a subtitle: 'Complete client sales and schedule courier dispatch.' The form has tabs for 'Order', 'Customer', 'Delivery', 'Items', 'Payment', 'Fulfillment', and 'GL / Audit'. The 'Items' tab is selected.

Under 'General Information', there is a table with columns: Product, Qty, Price, Disc., Tax, Total, Sub., and Notes. The first row shows 'The Juliet Rose Classic (\$125)' with a quantity of 9999, a price of 0, and a total of \$0.00. The 'Sub.' column has a checkbox checked, and the 'Notes' column contains 'e.g. Keep pink'.

Below the table, a yellow warning box titled 'Backorder Detected' is displayed. It contains the following information:

- Backorder Reason ***: A dropdown menu with the text '-- Select a reason --'.
- Expected Restock Date**: A text input field with a date format 'mm/dd/yyyy' and a calendar icon.
- Customer Note**: A text input field with the text 'e.g. Remaining stems ship after vendor restock.'
- Available: 450 · Ordered: 9999 · Backordered: 9549**
- You can save this draft, but a backorder reason is required before the order can be confirmed.**

Below the warning box, there is a '+ Add Product Line' button.

At the bottom of the form, there is a summary section with the following values:

- Subtotal:** \$0.00
- Discount:** \$0.00
- Taxes:** \$0.40
- Delivery Fee:** \$9.99
- Grand Total:** \$10.39
- Estimated Margin:** \$10.39 (100%)

At the bottom right of the form, there are three buttons: 'Cancel', 'Save Draft', and 'Create'.

The backorder card, live in the order editor: the Available · Ordered · Backordered figures (top right of the card), the **Backorder Reason** selector (required to confirm), **Expected Restock Date**, and the customer-facing note.

FIELD	MEANING
Available	Stock on hand for the line's SKU right now
Ordered	The quantity on this order line
Backordered	The shortage — calculated automatically, never typed
Reason (<i>required to confirm</i>)	Why the shortage exists — see the list below
Expected Restock Date	When you expect to fulfill the remainder
Customer Note	Customer-facing explanation, e.g. "8 stems ship after vendor restock"

Backorder reasons

Vendor shipment delay · Seasonal product shortage · Supplier out of stock · Partial inventory available · Special-order item · Quality hold / damaged stock · Awaiting purchase order receipt · Other (*requires a written detail*).

The rules

- **Drafts are forgiving.** You may save a draft while shortage information is incomplete — the card shows a gentle reminder.
- **Confirmation is strict.** Moving the order beyond Draft requires a reason on every backordered line. Choosing **Other** requires the detail text.
- **Each line stands alone.** Two short lines need two reasons.
- **Resolved means clean.** Reduce the quantity to within stock and the card — along with the stale reason, date, and note — is removed from the order.

WARNING — Why can't I confirm this order?

If confirming is blocked with a message about backordered items, one or more short lines are missing a reason (or "Other" is missing its detail). The editor jumps to the Items tab — complete the amber card and save again. This is the shortage-documentation rule working as intended.

BEST PRACTICE

Confirm quantities against inventory *before* confirming an order. A shortage caught at the counter is a phone call; a shortage caught in production is an apology.

Example — the Grand Hotel gala

The Grand Hotel orders 20 Premium Red Rose boxes; you have 12. The card shows Available 12 · Ordered 20 · Backordered 8. You select **Vendor shipment delay**, set Tuesday as the expected restock, and note "8 boxes follow after our Tuesday delivery." The order confirms cleanly, production starts on the 12, and everyone — including the customer — knows the plan for the 8.

DESIGNER & PRODUCTION WORKFLOW

~4 min read

09

From confirmed order to finished arrangement.

DESIGNER

MANAGER

ADMIN

Overview

Production lives on the **Dashboard** → **Today's Operations** panel. The production queue lists confirmed work; the urgent list surfaces today's deliveries and high-priority orders with a single **Resolve Status** action that always moves the order to its next stage.

Start and finish production

- 1 Open **Dashboard** and review the production queue and urgent list.
- 2 Select **Resolve Status** on a confirmed order — it moves to **In Design**. The designer builds the arrangement.
- 3 Select **Resolve Status** again — the order becomes **Ready** and waits in the cooler for dispatch.

WHAT HAPPENS NEXT

Each move is saved immediately, stamped in the order's audit history, and reflected everywhere — the Orders pipeline filters, the dashboard counts, and the delivery queue.

A production morning

8:00 — Three arrangements due today. The urgent list shows all three. 8:05 — First order to **In Design**; roses from the cooler. 8:40 — Marked **Ready**. The next order starts. By 10:30 all three sit in the cooler as Ready, and dispatch takes over.

TIP

The Resolve Status button disables itself while a change is saving — one click is always enough.

READY & DELIVERY OPERATIONS

10

Dispatch, out-for-delivery, and completing the drop.

~4 min read

DISPATCHER

DRIVER

MANAGER

ADMIN

Overview

The **Deliveries** module manages dispatch details — couriers, routes, delivery notes, and proof of delivery — while status moves can be made from the Dashboard or the Orders list.

Deliveries: courier assignment, dispatch details, and delivery status in one place.

Dispatch and complete a delivery

- 1 From the Dashboard urgent list, select **Resolve Status** on a **Ready** order — it becomes **Out for Delivery**. Assign the driver if not already assigned.
- 2 When the flowers are in the recipient's hands, mark the order **Delivered**.

WHAT HAPPENS NEXT

Delivered stamps the delivery time, records the order's cost of goods against your inventory (Chapter 15), and finishes the lifecycle.

IMPORTANT

Delivery completion is blocked while the order has a remaining balance. Record the payment first (Chapter 11), then deliver. The block message states the outstanding amount.

BEST PRACTICE

Assign drivers at dispatch, not after. The driver name on the order is what makes tomorrow's "who delivered this?" question answerable in seconds.

11

PAYMENTS & ACCOUNTS RECEIVABLE

Record money in, track balances, manage collections.

~6 min read

Overview

Use this module when... a customer pays a deposit · you receive final payment before delivery · reviewing who owes what · working collections on overdue balances.

Receivables: open balances by customer, payment recording, and allocation to orders.

Record a payment

- 1 Open **Receivables**.
- 2 Find the customer and record the payment amount and method.
- 3 Allocate the payment to one or more open orders.
- 4 Save, then verify the customer's remaining balance reflects the payment.

WHAT HAPPENS NEXT

The payment reduces the allocated orders' balances and the customer's total receivable. A partial payment leaves the remainder due; a full payment clears the way for delivery completion.

Four words that are not the same

TERM	WHAT IT MEANS
Cancel	The order will not happen. Allowed before delivery; books are corrected automatically if the sale was already posted.
Refund	A delivered order is being given back / made good. Only delivered orders can be refunded.
Payment reversal	Undoing a recorded customer payment (wrong amount, bounced card) — the order balance reopens.
Journal reversal	The accounting correction behind the scenes: a matching opposite entry that nets a posted entry to zero while keeping history intact (Chapter 17).

BEST PRACTICE

Record payments the moment they arrive, and allocate them immediately. Unallocated cash is tomorrow's mystery.

12

CUSTOMER STATEMENTS

A customer's activity, balances, and history — exportable.

~3 min read

OWNER

ADMIN

ACCOUNTANT

Statements summarize a customer's orders, payments, and running balance over a period — the document you send corporate accounts at month end.

- 1 Open the customer's statement view from Receivables.
- 2 Choose the statement period (the cutoff date controls which activity is included).
- 3 Review the activity and closing balance.
- 4 Export as **PDF** (to send) or **Excel** (to analyze).

Example

The Grand Hotel runs a monthly account. On the 1st you generate their statement for last month: eleven orders, two payments, closing balance \$1,240. The PDF goes to their accounts team; the balance appears on your receivables aging until paid.

TIP

PDF for people, Excel for spreadsheets. The numbers are identical.

13

PURCHASING & VENDORS

Order stock from wholesalers with purchase orders.

~5 min read

OWNER

ADMIN

MANAGER

Overview

The **Purchasing** console manages vendors (your wholesalers), purchase orders (POs), receiving, and the bills that follow. A PO states what you are buying, from whom, at what cost — and becomes the reference receiving is checked against.

The Purchasing console: vendors, purchase orders, receiving, and vendor bills.

Create a purchase order

- 1 Open **Purchasing** and select the vendor (create the vendor first if new).
- 2 Create a purchase order with line items — SKU, quantity, unit cost.
- 3 Review totals and approve the PO according to your shop's practice.

WHAT HAPPENS NEXT

The PO waits for the physical delivery. When stems arrive, you receive against it (Chapter 14), which updates inventory quantities and costs.

Example — Tuesday roses

You order 200 Premium Red Roses at \$1.35/stem from Bloemen Wholesale for Tuesday. The PO records the commitment. Tuesday morning the boxes arrive; receiving turns the PO into real inventory — and its \$270 into your rose cost.

BEST PRACTICE

One PO per vendor delivery. It makes receiving checks and vendor bill matching effortless.

14

RECEIVING INVENTORY

Turn deliveries at the back door into accurate stock and cost.

~4 min read

OWNER

ADMIN

MANAGER

Receiving records what actually arrived against the PO. Quantities increase inventory; costs update your weighted average cost (Chapter 15); the vendor bill becomes payable (accounts payable).

- 1 Open the PO in **Purchasing** when the delivery arrives.
- 2 Count the boxes. Enter the quantities actually received — receive partially where supported if the delivery is short.
- 3 Confirm the receipt.

WHAT HAPPENS NEXT

Inventory quantities rise immediately, each SKU's average cost is re-weighted with the new receipt cost, and the amount owed to the vendor is recorded for accounts payable.

WARNING

Receiving is where inventory truth is made. Receiving 200 when 180 arrived means twenty phantom roses — shortage warnings that never fire, and margins that flatter you falsely.

BEST PRACTICE

Count before you sign the driver's slip, and receive in BloomPro Studio the same hour. Same-day receiving keeps stock, cost, and payables all true.

15

INVENTORY COSTING: WAC, COGS & MARGIN

What your flowers really cost, and what each order really earns.

~5 min read

OWNER

ADMIN

ACCOUNTANT

Weighted Average Cost, simply

Flower prices change weekly. BloomPro Studio blends every receipt into a single honest number per SKU — the **weighted average cost (WAC)**:

	STEMS	COST EACH	VALUE
Current inventory	10	\$1.00	\$10.00
New receipt	10	\$1.50	\$15.00
New weighted average	20	\$1.25	\$25.00

\$25.00 of value ÷ 20 stems = \$1.25 per stem. Every receipt re-weights the average.

COGS and margin

When an order is **Delivered**, BloomPro Studio records its **Cost of Goods Sold (COGS)** — the stems consumed, valued at their weighted average cost — and keeps a cost snapshot on the order. Margin follows naturally:

$$\text{Revenue} - \text{COGS} = \text{Gross margin}$$

An \$85 bouquet consuming \$19.50 of stems earns \$65.50 gross. This is why receiving accuracy (Chapter 14) matters: WAC feeds COGS, and COGS feeds every profit number in your reports.

IMPORTANT

COGS is recorded once per order at delivery. Marking delivered twice will not double-count your costs.

16

INVENTORY ADJUSTMENTS & SPOILAGE

Keep counts honest when flowers wilt, break, or walk away.

~3 min read

OWNER

ADMIN

MANAGER

Flowers are perishable. Adjustments record the difference between what the system says and what the cooler holds — with a reason:

SITUATION	ADJUSTMENT	EXAMPLE
Spoilage	Reduce quantity, reason: spoiled/expired	Two dozen roses browned over a hot weekend
Shrinkage	Reduce quantity, reason: loss/damage	A dropped vase case; miscounted delivery
Correction	Set quantity to the physical count	Weekly cooler count finds 96, system says 100

WHAT HAPPENS NEXT

The quantity changes immediately and the financial effect of lost stock flows into your books, so spoiled inventory is not silently carried as an asset.

BEST PRACTICE

Record spoilage daily, at close. It takes thirty seconds and keeps shortage detection, WAC, and your margin reports truthful.

17 FINANCE & GENERAL LEDGER

Your books, in plain language.

~6 min read

OWNER

ADMIN

ACCOUNTANT

Overview

The **Finance** module holds your chart of accounts, journal entries, and period controls. You rarely need to write entries by hand — orders, payments, deliveries, and receiving post their own accounting automatically. Finance is where you review it.

Finance: journal entries with full line detail, reversal actions, and accounting period controls.

Double-entry, with flowers

Every financial event records two sides that always balance. When Maria's \$85 bouquet is sold on account:

ACCOUNT	DEBIT	CREDIT
Accounts Receivable (Maria owes you)	\$85.00	
Sales Revenue (you earned it)		\$85.00

Debit and **credit** are just the two sides of the same event. If they didn't match, money would appear or vanish — so BloomPro Studio only posts balanced entries.

Posting, reversals, and periods

- **Posting** writes an entry into the ledger. Orders post their sale when created; COGS posts at delivery.
- **Reversal** is how posted history is corrected: a matching opposite entry nets the original to zero. Both remain visible. Posted activity is never silently rewritten.
- **Period controls** let owners/accountants lock a closed accounting period so past months cannot drift; unlocking requires a documented reason.

ADMIN ONLY

Manual journal reversal and accounting-period lock/unlock are administrative actions, available to owner/admin-level finance roles.

WARNING

Reversals are immutable corrections, not deletions. If a posted entry looks wrong, reverse it and post the correct one — that is the discipline auditors expect.

18

RECONCILIATION

Prove your records match reality,
on a schedule.

~3 min read

OWNER

ADMIN

ACCOUNTANT

MANAGER

Reconciliation is a periodic check that your operational records and your books agree — the flower-shop equivalent of balancing the till. The AI Reconciliation module runs a scan over a date range, surfaces **exceptions** (differences it found), and lets authorized users propose **adjustments** that go through approval before they touch the ledger.

- 1 Open **AI Reconciliation** and choose the period to scan.
- 2 Run the scan and review each exception — every difference has a story: a missed payment allocation, an unposted order, a spoilage never recorded.
- 3 Resolve each one at its source where possible; propose an adjustment when a correcting entry is genuinely needed.

IMPORTANT

Proposed adjustments require approval before posting, and each carries balanced journal lines — reconciliation corrects your books with the same discipline as every other posting.

BEST PRACTICE

Reconcile monthly, before locking the period. Small months reconcile in minutes; skipped months compound.

19

REPORTS & EXPORTS

Business intelligence you can hand to anyone.

~3 min read

OWNER ADMIN
MANAGER ACCOUNTANT

The **Reports** module presents KPIs and operational analytics — revenue, pipeline, margin intelligence — and most list views (orders, statements, financial data) export to **PDF** and **Excel**.

Reports: KPIs and analytics for the active company.

CHOOSE	WHEN
PDF	Sending to a person: statements, end-of-day summaries, anything read as a document
Excel	Working with the numbers: pivots, filters, your accountant's month-end workpapers

TIP

Exports carry your company identity — display name, currency, language, and the report footer configured in Company Settings (Chapter 24). Set those once and every export looks official.

20

EVENTS & QUICK ACTIONS

Weddings, funerals, corporate work
— and faster daily moves.

~3 min read

OWNER	ADMIN
MANAGER	SALES

The **Events** module tracks larger engagements — a wedding, a funeral service, a corporate installation — with their own dates, budgets, clients, and status, separate from (but alongside) day-to-day orders.

Quick actions across BloomPro Studio reduce navigation: dashboard panels act directly on orders and inventory (confirm, assign, restock, resolve status), and list rows carry their own status and edit controls — so routine moves never require opening a full record.

BEST PRACTICE

Use Events for anything with a date and a budget bigger than a single arrangement; use ordinary orders for daily work. Mixing the two makes both harder to read.

21

BRANCH OPERATIONS

Multiple locations under one company.

~2 min read

OWNER

ADMIN

MANAGER

Branches represent your company's physical locations — the downtown shop, the market stall. Under **Settings** → **Branch Operations**, owners and admins maintain branch records (code, display name, status). Branches belong to the company; users can have a default branch preference.

IMPORTANT

Branches are organizational records within a company. They do not create separate data worlds — that is what companies do (Chapter 23).

22

USERS, ROLES & PERMISSIONS

Who can do what — and why that's a feature.

~5 min read

OWNER

ADMIN

Roles are per company

Your permissions come from your **membership role in the active company** — the badge in the top bar shows it. The same person can be an Admin in one company and a Viewer in another.

CAPABILITY	OWNER	ADMIN	MANAGER	SALES	DESIGNER	ACCOUNT/DISPATCH	DRIVER	VIEWER
View company & reports	•	•	•	•	•	•	•	•
Manage customers	•	•	•	•

Manage payments	•	•	•	•		•		
Post finance / view GL	•	•	view			•		
Export reports	•	•	•			•		
Deliveries update	•	•	•				•	•
Manage users & roles	•	•						
Company settings	•	•						

Settings: Company Settings · Default Language & Base Currency · User Access Control · Branch Operations.

ADMIN ONLY

User Access Control (invite, role changes, enable/disable, remove) is owner/admin territory. Your own row's role selector is intentionally disabled — nobody edits their own role.

WARNING

Role security is enforced by the platform itself, not just the screen. Users cannot promote themselves, read-only roles cannot create records, and no supported procedure bypasses these rules. If you need more access, ask an owner or admin to change your role.

Common questions

Why can't I edit a user's role? You need owner/admin in the active company — and no one can edit their own row.

Why is a whole module missing from my sidebar? Role-based visibility. Viewer sees far less than Manager by design.

23

MULTI-COMPANY OPERATIONS

One login, cleanly separated businesses.

~3 min read

ALL
ROLES

BloomPro Studio can host multiple companies — separate florist businesses with separate customers, orders, inventory, and books. Your **active company** (shown in the top bar) determines every record you see. If you belong to more than one company, switch using the company selector; your role may differ per company.

YOUR COMPANY DATA

BloomPro Studio separates company data according to company membership and application authorization rules. Records from a company you do not belong to are not visible, searchable, or reachable — this is enforced by the platform, not by the screen you happen to be on.

Why can't I see another company's information? You are not a member of it, or it is not your active company. Membership is provisioned by administrators — there is no self-service way to join a company.

24

COMPANY SETTINGS

Identity, currency, language, and report presentation.

~3 min read

OWNER

ADMIN

Under **Settings**, owners and admins configure the company profile and operating defaults:

SETTING	WHAT IT AFFECTS
Company profile / display name	How your business is identified across the app and on exports
Base currency	How money is displayed and reported
Default language	The starting interface language for the company (members can prefer their own)
Report options & footer	The professional footer and presentation on PDF/Excel exports

TIP

Set the report footer once — every exported statement and report instantly looks like official company paper.

25

LANGUAGES & LOCALIZATION

Work in the language your team thinks in.

~2 min read

ALL
ROLES

BloomPro Studio's interface is available in four languages:

LANGUAGE	DISPLAY NAME
English	English
Spanish	Español
French	Français
Dutch	Nederlands

Switch anytime from the language selector in the top bar. Interface labels, messages, and workflow text follow your selection; your business data (names, notes, orders) stays exactly as entered. A company default language applies first; each member's own preference is remembered.

26

NOTIFICATIONS

The bell that keeps operations honest.

~2 min read

ALL ROLES

The **bell icon** in the top bar surfaces operational alerts inside the application — the kind of things the Dashboard also watches: work needing attention, low stock, and items worth a look. Open the bell to review them; act on each by visiting the module it points to.

In addition, every action you take answers immediately with a **toast message** — a brief confirmation (success) or explanation (why something was blocked). A success toast means the change is genuinely saved.

IMPORTANT

Notifications live inside BloomPro Studio. The platform does not send SMS or push notifications to your phone.

27

COMMON DAILY
WORKFLOWS

Recipe cards for the moves you make every day.

Reference

ALL
ROLES**Start the business day**

Goal: know today's work in 5 minutes

1. Open Dashboard
2. Review Today's Operations & urgent list
3. Check Action Required for low stock

Result: a clear picture of deliveries, production, and gaps.

Create a customer order

Goal: phone order to confirmed sale

1. Orders → Create Order
2. Customer, delivery, items, payment
3. Status Confirmed → Create

Result: numbered order in the pipeline, sale on the books.

Handle a product shortage

Goal: confirm a short order responsibly

1. Note the amber Backorder card
2. Choose the reason; add restock date & note
3. Save / confirm

Result: documented shortage; production knows the plan.

Start designing an order

Goal: move confirmed work into production

1. Dashboard → urgent/production queue
2. Resolve Status → In Design

Result: order visibly in production; audit trail updated.

Mark an arrangement ready

Goal: finished work waits for dispatch

1. Resolve Status on the In-Design order

Result: order Ready; dispatch can plan the run.

Dispatch an order

Goal: flowers leave with a driver

1. Assign the driver
2. Resolve Status → Out for Delivery

Result: order in transit with a named driver.

Complete a delivery

Goal: close the loop

1. Confirm balance is zero (record payment if not)
2. Mark Delivered

Result: delivery time stamped; COGS recorded; lifecycle complete.

Record a customer payment

Goal: money in, balance down

1. Receivables → find customer
2. Record amount & method; allocate
3. Verify remaining balance

Result: balances and receivables reflect the payment.

Review accounts receivable

Goal: know who owes what

1. Open Receivables
2. Scan open balances & aging
3. Follow up on overdue accounts

Result: collections happen before they become problems.

Create a purchase order

Goal: commit next week's stems

1. Purchasing → select vendor
2. Add lines (SKU, qty, cost)
3. Approve

Result: PO awaiting delivery; receiving has its reference.

Receive inventory

Goal: boxes into truth

1. Open the PO on arrival
2. Count; enter actual quantities
3. Confirm receipt

Result: stock up, WAC re-weighted, vendor payable recorded.

Record spoilage

Goal: cooler and system agree

1. Inventory → adjust the SKU
2. Reduce quantity; reason: spoilage

Result: honest stock; loss reflected in the books.

Review daily financial activity

Goal: end the day reconciled

1. Finance → today's journal entries
2. Orders → any unposted rows → Post to Ledger

Result: books current; tomorrow starts clean.

28

TROUBLESHOOTING

Organized by the question you're actually asking.

Reference

QUESTION	POSSIBLE CAUSE → WHAT TO CHECK → ACTION
Why can't I confirm an order?	A backordered line is missing its reason (or "Other" detail). Check the Items tab's amber card → complete the reason → save. Required fields on other tabs (highlighted) can also block. <i>Escalate</i> : only if no field is highlighted anywhere.
Why can't I change an order status?	Lifecycle guard: cancelled/refunded are final; delivered can't be cancelled; refunds require delivered. The block message names the rule. Action: use the correct workflow (refund vs cancel).
Why can't I mark an order Delivered?	A balance remains. Check the order's balance due → record the payment (Ch. 11) → deliver.
Why do I see a backorder warning?	Ordered > available for that SKU. Check Inventory → either reduce quantity, restock, or document the reason and proceed.
Why is a reason required?	Shortage documentation is mandatory beyond Draft. It protects the customer promise and the production plan. Choose the closest reason; "Other" plus detail if none fit.
Why can't I edit a user's role?	You need owner/admin in the active company — and your own row is always locked. Ask an administrator.
Why can't I see another company's data?	You are not a member, or it isn't your active company. Membership is administrator-provisioned. This is data isolation working.
Why is an admin feature unavailable?	Role-based access. Check your badge (top-right). If your duties changed, an owner/admin can change your role.
Why did a save fail?	Look for the error toast — it states the reason (validation, permissions, or a business rule). Fix what it names and retry. A save that fails is <i>not</i> stored: what you see after a reload is the truth.
I got an error I don't understand.	Note the exact message and what you were doing → retry once → if it repeats, contact your administrator with both. Never

attempt workarounds that bypass a stated rule.

29

BEST PRACTICES

The habits of a well-run flower shop.

Reference

CUSTOMER DATA

One customer, one dossier. Search before creating; keep contact details current.

REVERSALS

Never chase a wrong entry by editing history — reverse it and post the correction. Both stay visible; that is the point.

INVENTORY

Weekly counts, same-day receiving, daily spoilage. Inventory truth is the foundation under every other number.

USER ACCESS

Review User Access Control quarterly. Departed staff off; roles matched to duties; least privilege by default.

ORDERS

Confirm only what you can explain: quantities checked, shortages documented, delivery details complete.

COMPANY SETTINGS

Revisit currency, language, and the report footer whenever your business identity changes.

BACKORDERS

The reason field is a promise to the customer. Write reasons a colleague could act on.

RECONCILIATION

Monthly, before locking the period. Exceptions are cheapest when fresh.

RECEIVING

Count before signing. Enter what arrived, not what was ordered.

EXPORTS

Export month-end statements and key reports and archive them — your books deserve backups outside the app too.

PAYMENTS

Record and allocate the same day. Verify the balance after every payment.

30

GLOSSARY

Plain-language definitions.

Reference

Accounts Payable

Money you owe vendors for goods received.

Accounts Receivable

Money customers owe you for orders.

Active Company

The company whose data you are currently working in.

Backorder

The portion of an order line that exceeds available stock.

Balance Due

Order grand total minus amount paid.

Branch

A physical location belonging to a company.

COGS

Cost of Goods Sold — the stem cost consumed by a delivered order.

Confirmed

Order status: a committed sale, ready for scheduling/production.

Credit

One side of a journal entry (e.g., revenue earned).

Customer Statement

A period summary of a customer's orders, payments, and balance.

Debit

The other side of a journal entry (e.g., a receivable created).

Delivered

Final lifecycle status; stamps delivery time and records COGS.

Draft

An order being written up; not yet a commitment.

General Ledger

The book of all journal entries — your accounting record.

In Design

Order status: a designer is building the arrangement.

Inventory Adjustment

A recorded correction to stock (spoilage, shrinkage, counts).

Journal Entry

A balanced debit/credit record of one financial event.

Margin

Revenue minus COGS.

Order Number

The customer-facing BLM- identifier of an order.

Out for Delivery

Order status: with a driver.

Posting

Writing an entry into the general ledger.

Purchase Order (PO)

A commitment to buy from a vendor; the receiving reference.

Ready

Order status: finished and awaiting dispatch.

Reconciliation

Periodic proof that records and books agree.

Refund

Making good a delivered order; reverses its financial effect.

Reversal

A matching opposite entry that corrects posted history without erasing it.

Scheduled

Order status: planned into a production day.

SKU

Stock Keeping Unit — the unique code for a stocked item.

Spoilage

Stock lost to perishability.

Viewer

A read-only company role.

Weighted Average Cost

Blended per-unit cost across all receipts of a SKU.

31

QUICK REFERENCE

For experienced users in a hurry.

Reference

Order status

Draft	quote; shortages may be undocumented
Confirmed	committed; shortages documented
Scheduled	planned
In Design	in production
Ready	awaiting dispatch
Out for Delivery	with driver
Delivered	final; needs zero balance; COGS records
Cancelled	final; auto-reverses posted sale
Refunded	final; delivered orders only

Inventory adjustments

Spoilage	reduce qty; reason spoiled/expired
Shrinkage	reduce qty; reason loss/damage
Count fix	set to physical count
Cadence	spoilage daily · counts weekly

Roles at a glance

Owner	everything
Admin	everything except ownership
Manager	operations + purchasing + payments
Sales	customers, orders, payments
Designer	orders + inventory
Accountant	payments + finance + exports
Dispatcher / Driver	deliveries
Viewer	read-only

Backorder

Detected	ordered > available (per line)
Quantity	always calculated, never typed
Draft	reason optional
Confirm	reason required per line; "Other" needs detail
Resolved	reduce qty within stock → card & fields removed

Payments

Record	Receivables → customer → amount → allocate
Rule	paid amount ≤ grand total
Deliver	requires zero balance
Fix wrong entry	reversal, never silent edits

Navigation
